

# PARK ENTRY, REGULATORY, INTERPRETIVE & WAYFINDING

**SIGNAGE IS AN ESSENTIAL PART OF ANY PUBLIC SPACE, WHETHER IT'S  
A PARK, A MUSEUM, OR A HISTORICAL SITE.**

When it comes to effective signage, interpretive signage plays a crucial role in enhancing visitor experiences by providing important information and engaging storytelling. Our manufacturing facility can produce stunning interpretive signs from design to installation.

## Trees are my home

Tree hollows are essential features in the trunks or branches of both live and dead trees. Trees with hollows are called 'hollow trees' and can take a long time to form. Many hollow trees are 100+ - 150 years old.

**Why are they important?**

- Insects are essential for many of the ecosystems that surround us. Hollow trees provide a home for many insects, including bees, wasps, beetles and moths.
- Many native birds and small mammals use hollow trees as nesting sites.
- In the UK, cattle can die if they are unable to get to water. Some of the largest hollow trees in the UK are in the Cotswolds, where they are used as water butts.
- In the UK, many of the largest hollow trees are in the Cotswolds, where they are used as water butts.

**How are hollow trees created?**

Hollow trees are created by a process called 'decay'. This is when the wood of a tree is broken down by fungi and insects. The process can take many years to complete. The hollows are often found in the trunks of old trees, but can also be found in the branches.

**How can you get involved?**

There are many ways to get involved in tree conservation. You can join a tree survey, or you can help to plant new trees. You can also help to protect existing trees by reporting any damage or decay to your local council.

**Find out more**

For more information on tree conservation, visit our website at [www.treeconservation.org.uk](http://www.treeconservation.org.uk)

## Yellow-bellied glider

Yellow-bellied gliders (Petaurus australis) are tree shrews, nocturnal marsupials. They have a membrane on their back that allows them to glide from one tree to the next, allowing them to travel long distances across rainforests.

- They are omnivorous and eat a wide range of food, including insects, nectar, and fruit.
- They have a long tail that they use to balance and steer while gliding.
- They are very agile and can climb trees with ease.
- They are very social and live in groups called colonies.

Yellow-bellied gliders are found in the rainforests of eastern Australia, particularly in the areas around Sydney and Melbourne. They are a protected species and are found in several national parks and reserves.

Yellow-bellied gliders are very adaptable and can survive in a variety of habitats, including rainforests, eucalypt forests, and even urban areas. They are very resilient and can survive in areas with a high degree of human disturbance.

Yellow-bellied gliders are very important for the ecosystem and play a key role in the food chain. They are also very popular with the public and are a major attraction in many zoos and wildlife parks.

**What can you do?**

- **Protect their habitat:** Yellow-bellied gliders need a lot of trees and forest to live in. You can help by planting trees and protecting the forest.
- **Don't use pesticides:** Pesticides can be harmful to yellow-bellied gliders and other wildlife. You can help by not using pesticides in your garden.
- **Don't feed them:** Feeding yellow-bellied gliders can be harmful to them. You can help by not feeding them.
- **Don't touch them:** Touching yellow-bellied gliders can be harmful to them. You can help by not touching them.
- **Don't keep them:** Keeping yellow-bellied gliders as pets is illegal and can be harmful to them. You can help by not keeping them.

Yellow-bellied gliders are very important and we need to protect them. You can help by doing the things listed above.

Yellow-bellied gliders are very important and we need to protect them. You can help by doing the things listed above.
